info@bioeffektory.com - www.bioeffektory.com

Bioeffektory

Bioeffektory

It is made from humic acids and natural stone flour.

Effects of fundamental substances used are enhanced and improved by means of production processes.

Bioeffektory

It stimulates and activates plant hormones.

Plant hormones enable:

Flowering,

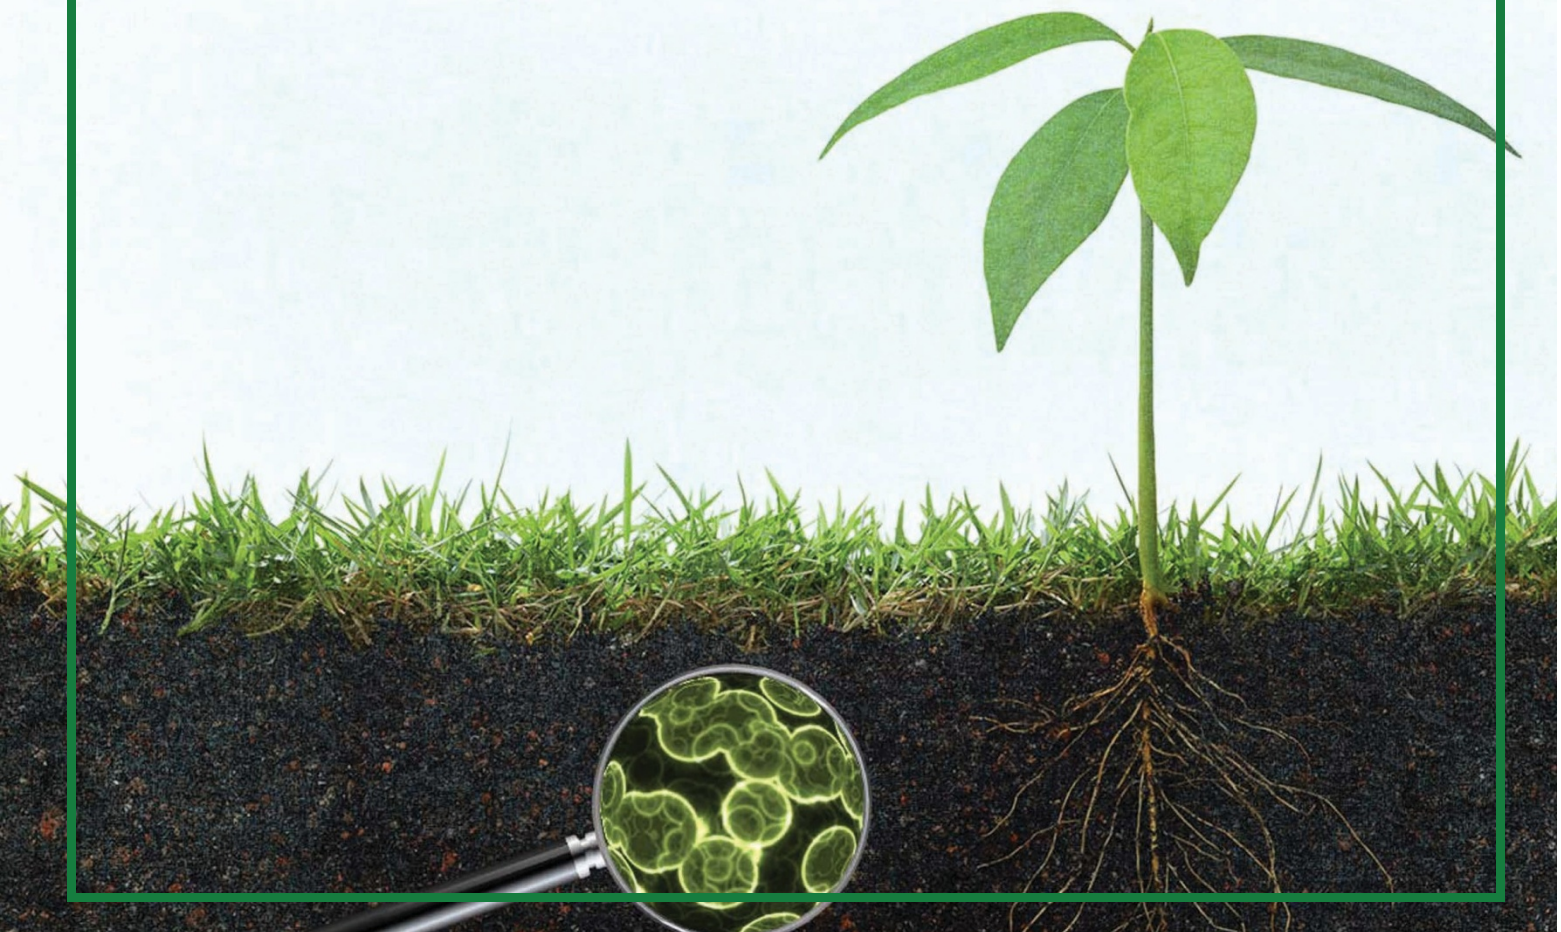

Fruit keeping of flowers,

Plant's getting nutrition from soil,

Tasting of fruit

Improvement of plant resistance against pests.

.

Bioeffektory

In damson plum shown in picture, Bioeffektory was applied before flowering. This application has increased amount of flower. At the same time, flowers became more reproductive with better pollination. Bees like healthy flowers.

Bioeffektory

Bioeffektory

Lemon example:

Fruits that have formed in healthy and well developed flowers have transformed into healthy and aromatic lemons of same size.

Bioeffactory was applied once in three weeks.

Bioeffactory

It enhances immunity against diseases.
It provides resistance against pests.

It was applied once in three weeks to the cotton in picture.
As plant has a very long flowering period,
It was subject to more number of harmful insects during this period.
Pesticides were not used in this plant.
There is no poisonous substance in cotton.

Bioeffektory

In the picture, you are seeing a peach. At the beginning of vegetation trees were in water and in first weeks it was very cold. First application was made before flower and afterwards application was continued once in each three weeks. Trees got over their stress successfully and they yielded plenty of aromatic fruits in harvest time.

Example of nutrition dynamics

In the picture a soya root is seen. Soya plant has a natural tendency to have symbiosis (common work) with bacteria binding nitrogen in the air. This nitrogen is directly given to plant. During symbiosis plant feeds bacteria and consumes energy. Synthesis takes place with this energy. In the picture it is seen that many extraordinary bacteria have formed.

Basically it is seen that in Bioeffactory application, nitrogen binding process required for processing of bacteria in soil and symbiosis is promoted. This enables for synthetic nitrogen obtained from air by using petroleum and gas to be used less.

Usage of bioeffactory both in leaves and soil reduces synthetic nitrogen usage by 30% and even 100%.

Bioeffactory

Example relating with harvest potential

If Bioeffactory is frequently applied for once in three weeks to soil by means of irrigation, chemicals needed against fungi and other pests will not be required. Harvest amount increases.

Tomato seedlings where chemical pesticides are not used against fungi and beneficial pests in the greenhouse is seen in picture above. During whole harvest period tomatoes are very healthy and aromatic. Besides only 30% of nitrogen amount required was used. Synthetic phosphorus was never used.

Phosphorus is normally present in soil but it is not always in resolution and binding required for plant.

By applying Bioeffactory, plant obtains phosphorus from soil as it requires.

Bioeffactory

Orange in the photo is injured due to hail. With flowering, meaning much earlier than hail, it was started with Bioeffactory application. Plant is so alive that damages due to hail have recovered by itself.

Bioeffactory

Immunity against stress

Peppers seen in above photo was raised in very hot environment. Plant was alive in all raising process and has not shown any stress indicator.

Bioeffactory application in seeds is giving its first results.
Seed was processed with Bioeffactory in corn plants seen in middle in photo,
prior to planting.

Bioeffactory

Bioeffektory

Plant activators

It activates natural mechanism of plant. It enables presentation of micro elements and nutritions, with high usability and as prepared for usage, as required for growth, development of plant and formation of strong root. It is enabled for nutrition elements required for growth and development to be available for plant usage.

In plant production, plant activators providing natural resistance against disease factors and stress conditions, stimulating natural defense system of plant with unique compounds in its content that activate them are used.

Besides natural solutions improving soil health and product efficiency are also used.

Bioeffektory

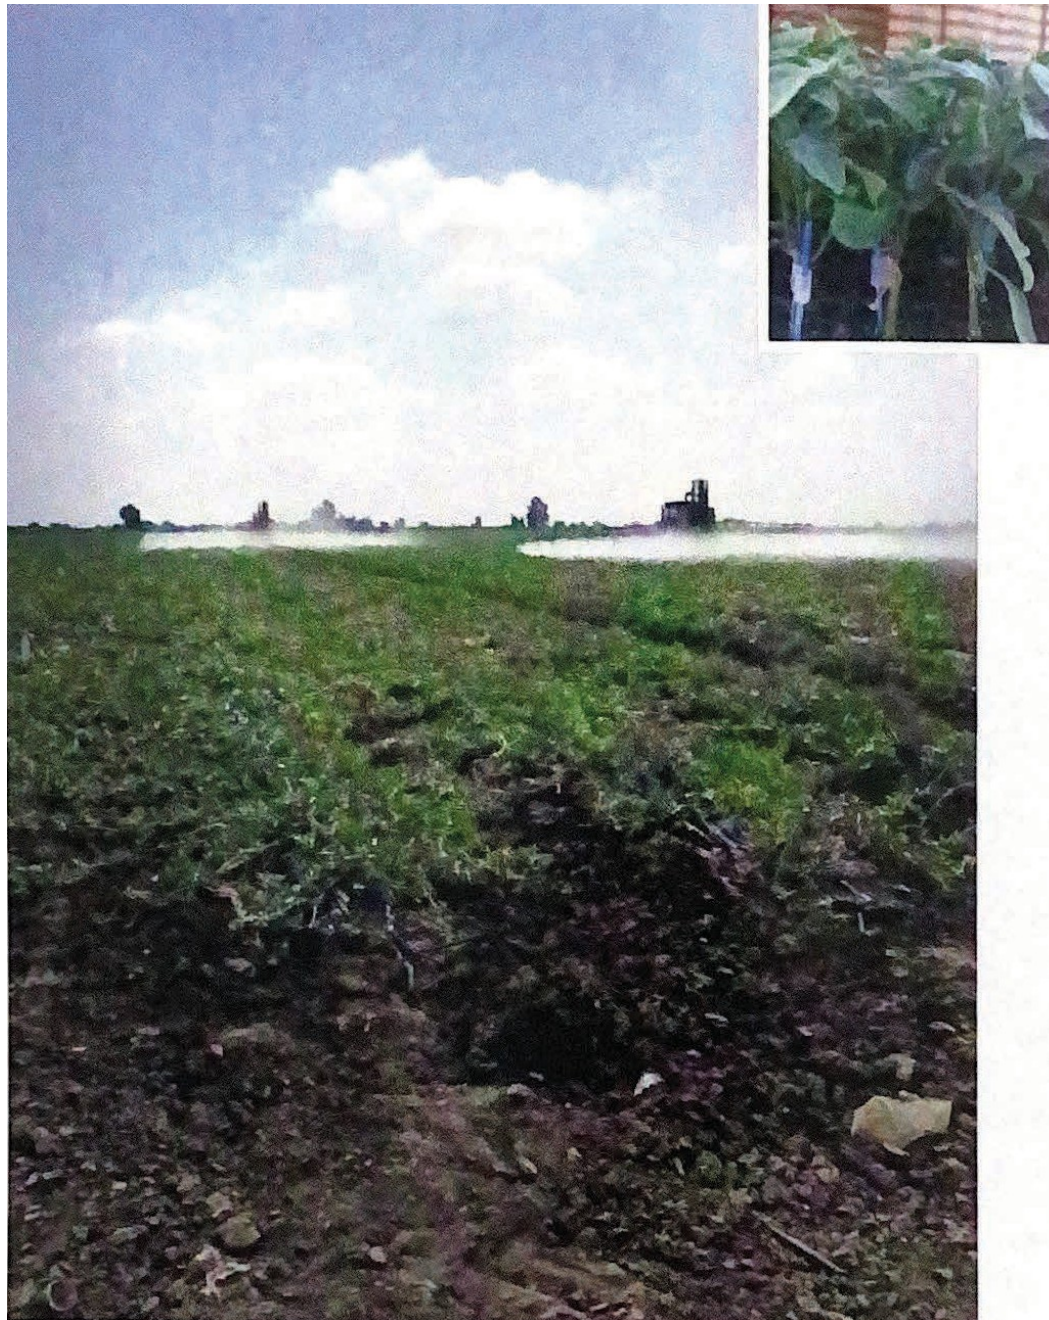

It increases organic substance in soil and it increases plant development and growth rate to maximum by enabling for nutrition element and vitamins directly by plant.

It makes clayey structure in soil become porous and it increases water retention capacity of soil.

By using nitrogen in air, it enables economical fertilization. It promotes development of shoots.
It enhances efficiency and quality.

It regulates soil structure, decreases saltiness, increases water retention capacity of soil.

By darkening soil color, it enables for soil to be heated more easily. By forming compounds with nutrition elements in form that can not be dissolved in soil, it transforms these elements into a form that can be absorbed.

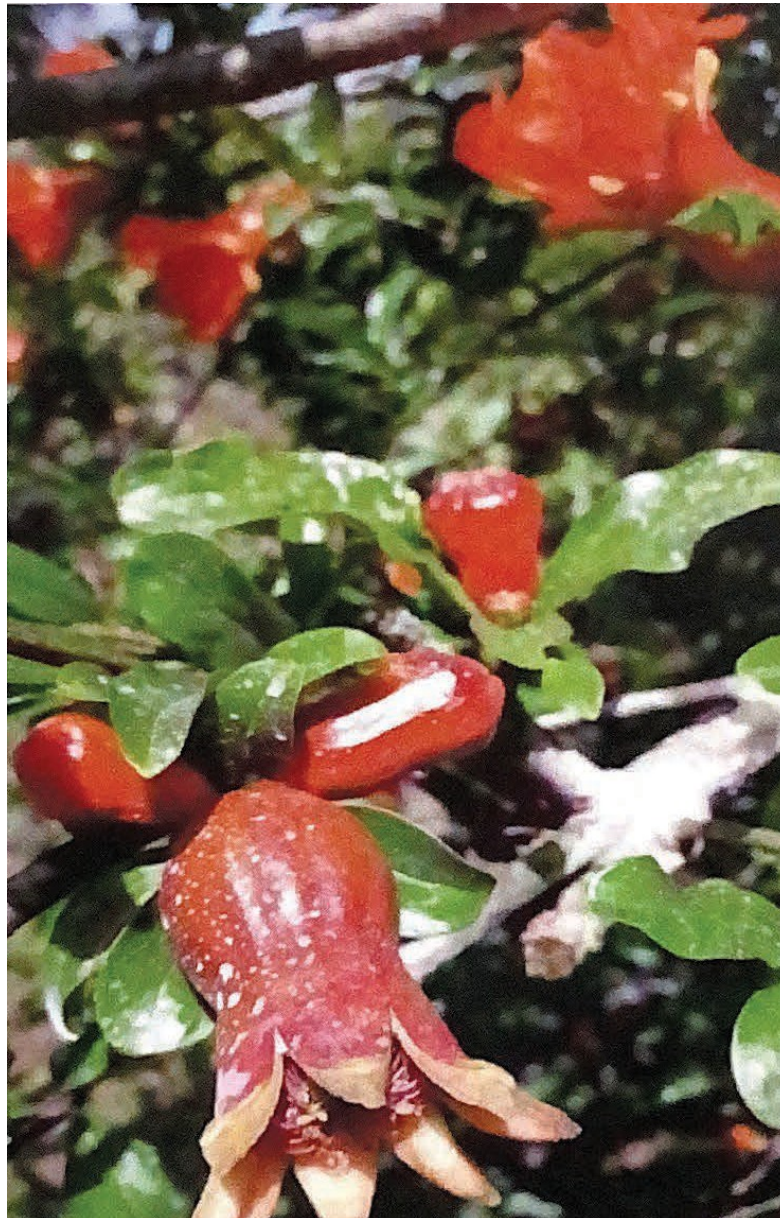

It increases cell division. It enables strong plant development and delays aging in many products. It increases resistance of plants against negative ecological conditions. It prevents falling of flowers and fruits. It increases size of fruits and improves quality.

It increases resistance of plant against climatic conditions. It improves carriage of plant nutrition substances and water in the plant. It promotes rooting and enables growth of healthy plant.

It enables for plant to realize all its physiological activities without problems. It ensures for plant to realize more efficient photosynthesis. It takes part in structure of enzymes that are needed in physiological process in plant growth and development and it contributes to formation of healthier root, leaf, and fruit relating with the plant. It makes metal elements become complex and accelerates intake of cell membranes of trace elements required for plant due to its feature of facilitating intake into plant structure.

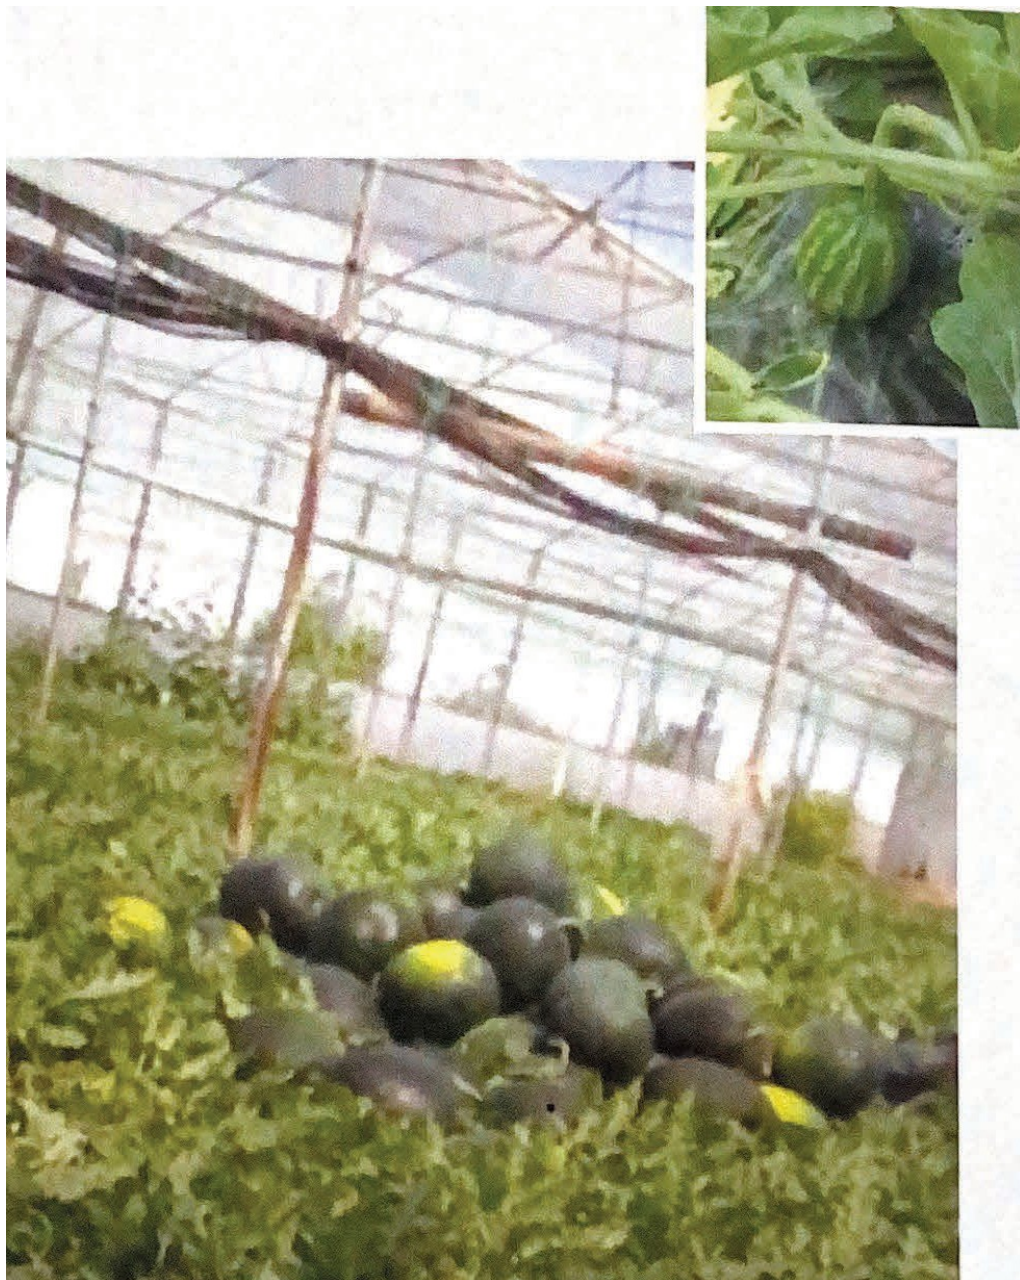

Bioeffektory

It improves soil, makes organic content and hummus content become richer. It reduces amount of salt that accumulates in soil in time. It ventilates soil, increases its water retention capacity, balances its pH.

It contains P20 form that can be quickly absorbed by plants. In leaf applications, amount of phosphorus in soil increases 2.5 folds 48 hours later. It provides healthy vegetative development and flowering increase.

It enables healthy holding of progeny and strong rooting. It increases vegetative development. It prevents falling of flowers due to lack of phosphorus and zinc in plants.

İşimiz "ORGANİK TARIM"

Bioeffektory Ziraat İthalatı Hracat Sanayi ve Ticaret Ltd. Şti was established in Adana/Çukurova in 2015.

Currently it continues with its organic fertilizer production activities on an area of 25.000 m² at Antalya Organized Industrial Zone. As a result of chemical fertilizers and agricultural pesticides that are used unconsciously in a single direction for long years, soils were polluted and began to bear dangerous dimensions with respect to environmental health.

In our country which is in the process of entering European Union, regaining structural order of soils that are weathered with respect to various aspects in areas where organic or conventional agriculture is realized and enabling for producers to get more quality products constitute fundamental philosophy of this corporation. As efficiency and quality obtained due to usage of these fertilizers produced with high technology are high, in parallel with this customer satisfaction and increase in demand are also seen.
